

Atomic Design System Manual

Student: Angel Princess Palitayan

Atoms: Button, Typography, Color Tokens, Icon, and Image. Each has a dedicated reference file in `source-code/atoms/`.

Molecules: Heritage Card, Search Form, and Navigation Item. Each has a dedicated reference file in `source-code/molecules/`.

Organisms: Heritage Grid and Header Navigation. Each has a dedicated reference file in `source-code/organisms/`.

Responsive logic: desktop uses three cards per row, tablet uses two, and mobile uses one. Search controls stack on narrow screens and typography scales with `clamp()`.

Usage context: Atoms provide basic UI building blocks; molecules combine related atoms into reusable patterns; organisms combine molecules into complete page sections.

Visual preview: Open `source-code/index.html` in a browser. The rendered showcase displays the Button, Typography, Image, Navigation, Search Form, Heritage Cards and Heritage Grid together.

Accessibility: semantic landmarks, labeled search input, alternative image text, keyboard focus indicators, responsive layouts, and readable content structure are included.
